The importance of immunoassays

As part of the immune response, inflammation plays an important role in defending the body against pathogens such as viruses, bacteria, fungi, and other parasites. However, inappropriate activation of inflammatory processes is an underlying contributor to many common pathological conditions. For example, autoimmune conditions arise when our immune system mistakes our cells or tissues for pathogens and attacks them. In addition, studies show that tumor proliferation and metastasis may occur when inflammatory cytokines create a microenvironment conducive to cancer progression. Figure 1 shows a simplified representation of cytokine interactions during inflammation.

Acute versus chronic inflammation

Acute inflammation is a short-lived response that is characterized by extravasation of leukocytes, erythrocytes, and plasma components into the injured tissue. If left unchecked, the acute inflammatory process can lead to chronic inflammation.

Unlike acute inflammation, chronic inflammation is characterized primarily by tissue infiltration by lymphocytes and macrophages. Chronic inflammation is closely associated with allergy, atherosclerosis, cancer, arthritis, and Alzheimer's disease, as well as autoimmune diseases. The process of acute inflammation is well defined, but the causes of chronic inflammation and its associated molecular and cellular pathways are still not well understood [1].

Inflammation research

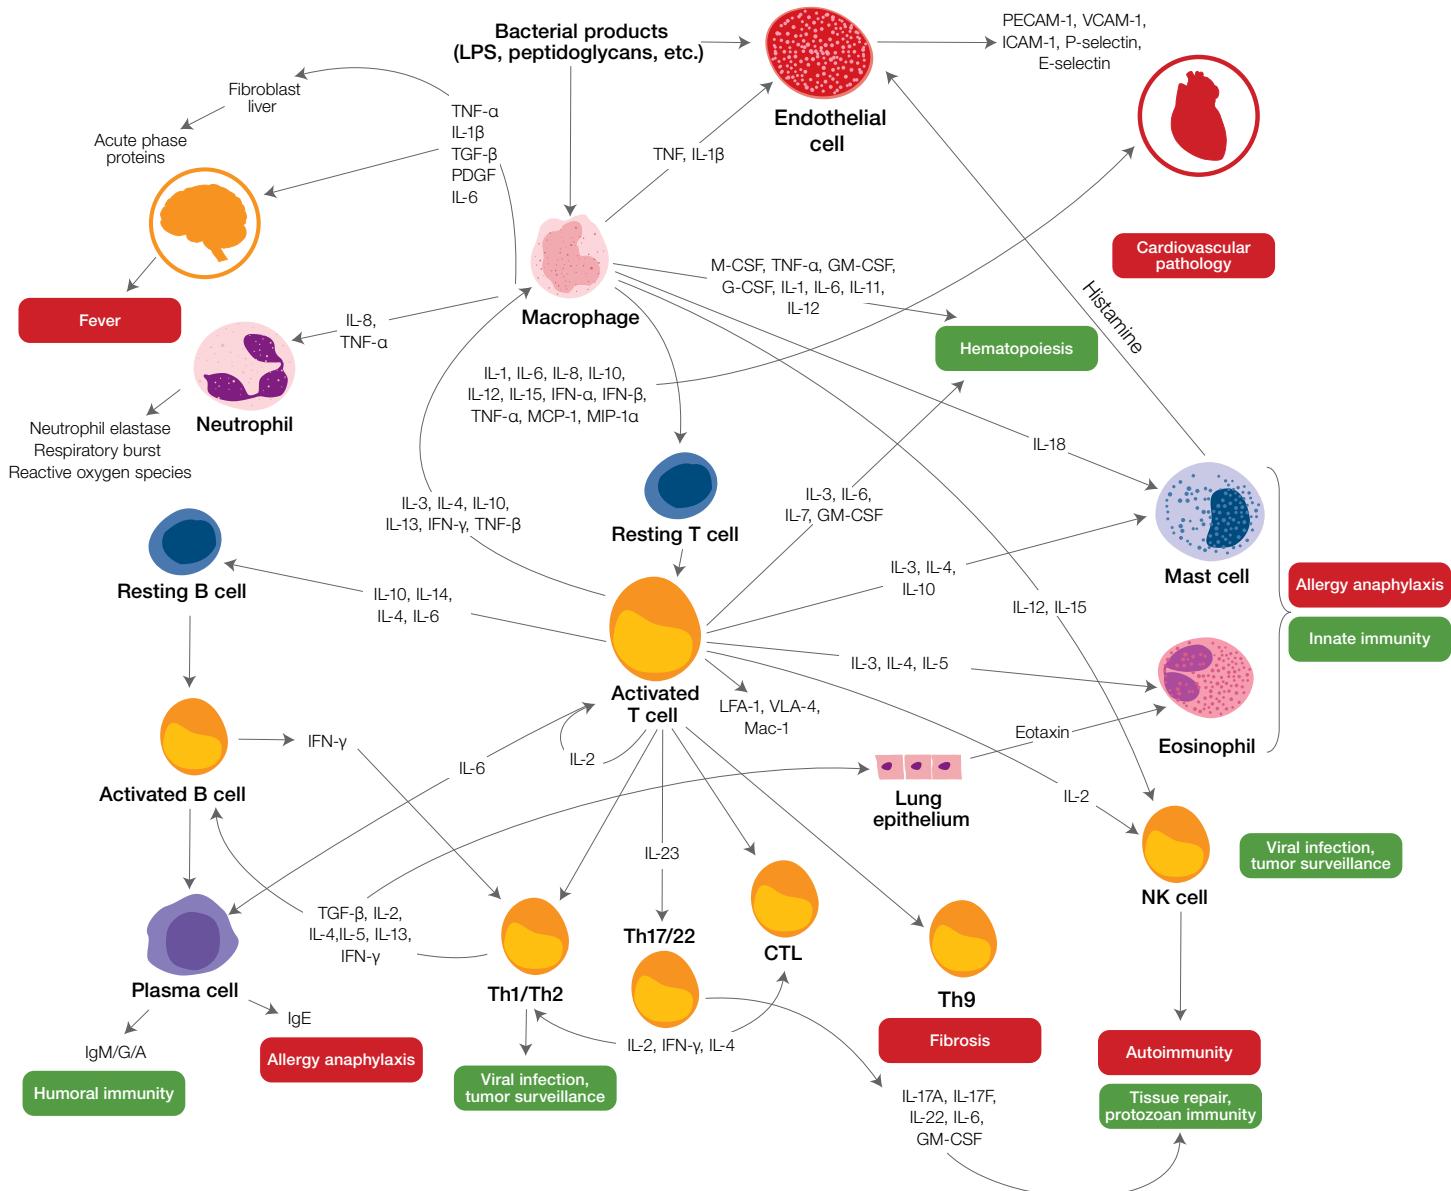

Figure 1. Interaction of cytokines during inflammation.

The critical balance between pro- and anti-inflammatory mediators

The overall effect of an inflammatory response is dictated by the balance between pro- and anti-inflammatory mediators (Table 1).

Pro-inflammatory cytokines such as IL-1 β , IL-6, and TNF- α are responsible for early responses and amplify inflammatory reactions, whereas anti-inflammatory cytokines, which include IL-4, IL-10, and IL-13, have the opposite effect in that they limit the inflammatory responses (Table 1). The increasing complexity of pro- and

anti-inflammatory cytokine/chemokine networks has made it crucial to examine them in relevant functional groups rather than individually (Figure 1).

To facilitate the investigation of inflammatory and other biologically relevant protein markers, the Invitrogen™ portfolio has a broad menu of immunoassays to easily detect and quantify proteins. Products are available for important research areas including immunology, Alzheimer's disease, cancer, cardiovascular diseases, metabolism, and more.

Plate- and bead-based solutions for your research needs across many species

Human, mouse, rat, nonhuman primate, canine, porcine, bovine, equine, and feline

The Invitrogen portfolio of immunoassay products support the evolution of research projects by offering multiple platforms that, in most cases, use the same antibody content. This provides freedom to move from one platform to another, or from a multiplex assay to an ELISA, producing truly comparable data.

- Keep your research relevant by incorporating analytes pertinent to your area of work at any point within your study
- Conserve resources by using existing data from previous experiments
- Validate at your discretion with identical antibody content across multiple platforms

Immunoassay platforms

Tailored to meet your needs

A variety of ELISA kit formats are available that include complete, ready-to-use kits as well as preoptimized reagents to make your own. A variety of singleplex and multiplex panels for the Luminex® platform are also available. See Table 2 for a performance comparison of our immunoassay platforms and Table 3 for a component list.

- **Coated ELISA kits**—Quantitate with confidence. Highly verified ELISA kits with precoated plates provide lower inter- and intra-assay variability with ready-to-use reagents that help ensure consistent data throughout your research.
- **Invitrogen™ Instant ELISA kits**—Reduce steps and hands-on time to increase productivity. The one-wash ELISA introduces fewer handling steps, leaving more time for your research.

- **Phosphospecific ELISA kits**—Measure phosphospecific proteins in cell lysates.
- **Uncoated ELISA kits**—Keep costs low with our affordable coat-it-yourself ELISA plate set. Each set contains the reagents required to prepare and run the ELISA, including ELISA-optimized matched antibody pairs, standards, detection reagents, coating buffers, sample diluent, and tetramethylbenzidine (TMB) substrate solution. Plates are optional.
- **ProcartaPlex multiplex immunoassays**—Quantitate more with less sample. ProcartaPlex multiplex immunoassays utilize Luminex xMAP technology for the biomarker profiling of up to 65 analytes in a single 25–50 µL sample.

Instant ELISA: the one-wash ELISA kit

Reduce steps and hands-on time to increase productivity

The one-wash Instant ELISA kit requires fewer handling steps. The Instant ELISA plate contains all of the necessary components including capture antibody and lyophilized detection antibody, streptavidin-HRP, and sample diluent. Additionally, the strip wells containing the standards for the standard curve are provided separately; they are ready-to-use, saving both time and wells. Less hands-on time increases productivity, which leaves more time for your research (Table 5).

Coated ELISA kits

Precoated Benefits of Instant ELISA kits

- **Time saving**—only requires 15 min for setup
- **Maximum accuracy**—no need to add antibody or do serial dilution of standards; reduced handling means less error and more consistent results
- **Better value**—generate standard curve data in parallel with additional well strips provided, to enable use of all 96 wells for your samples

Switching to Instant ELISA kits

The Instant ELISA kits utilize the same antibody pairs for many analytes across all assay formats. This enables cross-platform performance and comparable data using any of our Instant ELISA kits, ELISA, and ProcartaPlex multiplex assays. For example, if you are currently using an Invitrogen™ sCD44var Coated ELISA, you can be confident in switching to the Invitrogen™ sCD44var Instant ELISA assay, knowing that the data generated across the two kits will remain consistent (Figure 6).

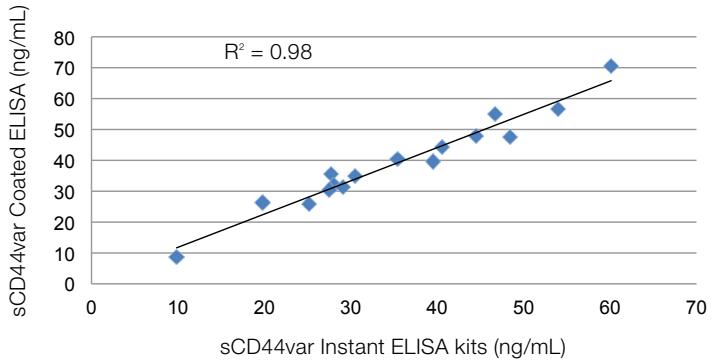

Figure 6. Performance comparison of human sCD44var Instant ELISA to coated ELISA. Human sCD44var Instant ELISA kit (Cat. No. BMS220INST) was tested against a human sCD44var Coated ELISA kit (Cat. No. BMS220). Sixteen serum samples were applied with the coefficient of determination of 0.98, demonstrating comparable performance of the Instant ELISA kits against coated ELISA kits.

Phosphospecific ELISA kits

Cell signaling assay

For studies of intracellular proteins involved in signaling, Invitrogen™ phosphospecific ELISA kits are available for measurement of total, and phosphorylated, modified, or cleavage site-specific proteins. Advantages and benefits of these kits include:

- **Specificity**—two antibodies directed against the analyte provide better specificity than western blotting
- **Sensitivity**—more sensitive than western blotting
- **Quantitation**—get quantitative data in contrast to western blots (Figure 7)
- **Medium throughput**—96-well format, results in 4 hours, no densitometry analysis needed

ProcartaPlex multiplex kits

Profile more biomarkers with less sample

ProcartaPlex multiplex immunoassays use the Luminex xMAP (multianalyte profiling) technology that enables the simultaneous detection and quantitation of up to 80 protein targets in a single 25–50 µL sample of plasma, serum, cell culture supernatants, and other bodily fluids. The technology employs the use of differentially dyed, capture beads for each target in a multiplex “ELISA-like” assay. ProcartaPlex immunoassays can profile up to 80 times more analytes using significantly less sample in the same time that it takes to perform a traditional sandwich ELISA. See typical ProcartaPlex assay sequence and multiplex data in Figure 11.

ProcartaPlex multiplex immunoassays provide the ability to create your unique panel and the assurance that you will achieve reproducible results throughout the course of your study.

- More than 90% of ProcartaPlex assays can be combined with one another
- High correlation to our Invitrogen™ coated ELISA assays ($R^2 > 0.9$)
- Scalable and reproducible performance regardless of plex size
- Largest multiplex panel on the market for quantitation of up to 65 analytes

ProcartaPlex multiplex immunoassays are available in multiple formats across six species (human, mouse, rat, nonhuman primate, porcine, and canine) to meet the needs of your research.

Go to thermofisher.com/procartaplex for information regarding characteristic assay details and individual analytes.

What is a Luminex-based assay?

Profile more biomarkers with less sample amount

Quantitate up to 80 analytes simultaneously with the Luminex 100/200 or FLEXMAP 3D system and up to 50 analytes with the Luminex MAGPIX system. All of our assays are compatible with as little as 25 µL of plasma or serum samples or 50 µL of cell culture supernatant sample.

High-throughput analysis

Measure several analytes simultaneously in the same time it takes to run a single ELISA assay. ProcartaPlex protocols are available in 96-well and 384-well formats for high-throughput analysis.

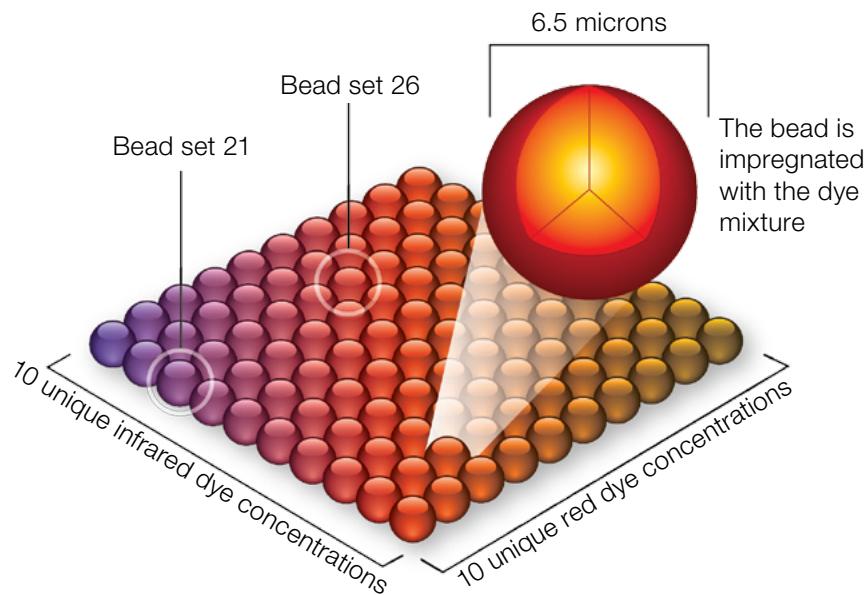

Trusted platform and partnership

Luminex Corporation has been supplying instruments to the life science research market for almost 20 years and has over 13,000 units installed worldwide. As a certified partner of Luminex Corporation, Thermo Fisher Scientific has been supplying multiplexed reagents for more than 15 years and has been a preferred supplier of high-quality assays to many customers in medical and drug discovery research.

ProcartaPlex technology overview

Luminex xMAP technology

ProcartaPlex assays use Luminex xMAP magnetic bead technology that uses the Luminex® MagPlex® superparamagnetic 6.5-micron microsphere beads with a magnetic core. The beads are internally dyed with precise proportions of red and infrared fluorophores. Varying proportions of the red and infrared fluorophores result in 100 spectrally unique microspheres, which are identified by the Luminex xMAP detection systems. The conjugation of a distinct monoclonal antibody to a distinct bead allows for analysis of multiple analytes in a single well.

Why ProcartaPlex assays?

Flexibility

Get exactly the panel you want. Since more than 90% of ProcartaPlex assays can be combined with one another, ProcartaPlex assays allow the creation of highly specific as well as high-plex panels. We currently offer the largest published panel with a 65-plex assay [1–4].

Reproducible results

ProcartaPlex assays are based on the principles of sandwich ELISA, where two highly specific antibodies recognize different epitopes on the same protein. Reproducible results come from reliable manufacturing. We own and operate a world-class hybridoma facility for the manufacturing of antibodies; and these antibodies are used in ProcartaPlex assays, enabling the delivery of consistent, reproducible, and high-quality assays.

Correlation to ELISA

Switch easily from ProcartaPlex assays to ELISA and vice versa with reliable results. Most of our ProcartaPlex assays use the same antibody pairs as our traditional plate-based ELISAs, resulting in high correlation ($R^2 > 0.9$) between the two assays. As shown in Figure 12, equivalent results ($R^2 > 0.9$) were obtained using the ProcartaPlex multiplex immunoassays and traditional plate-based ELISAs for human and mouse IFN gamma. ProcartaPlex assays achieve quantitative results comparable to traditional ELISA results with the added benefits of reduced sample volume, shorter assay time, and lower cost.

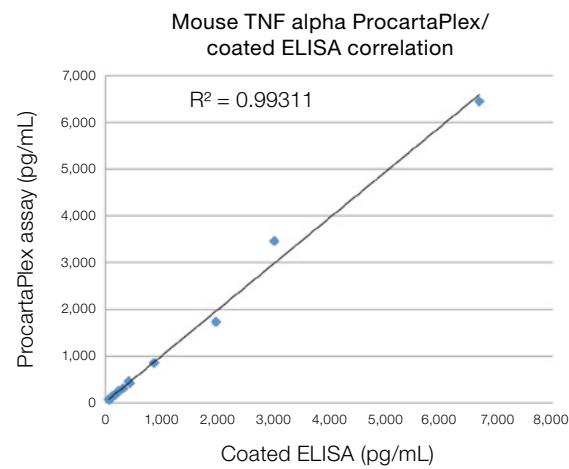

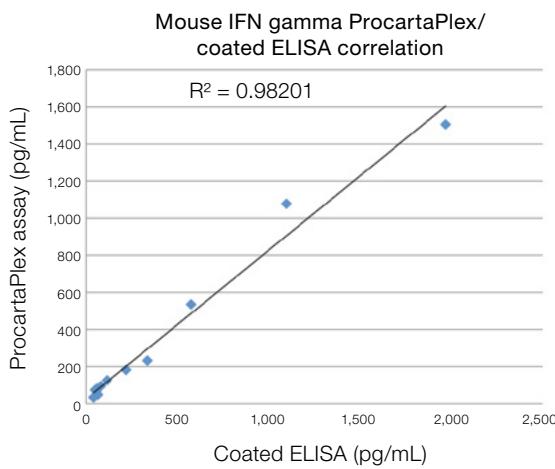

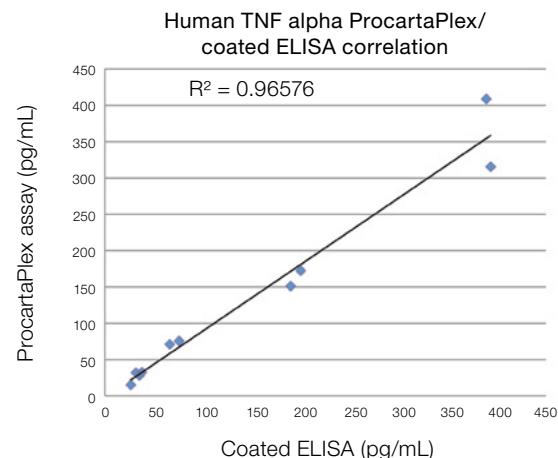

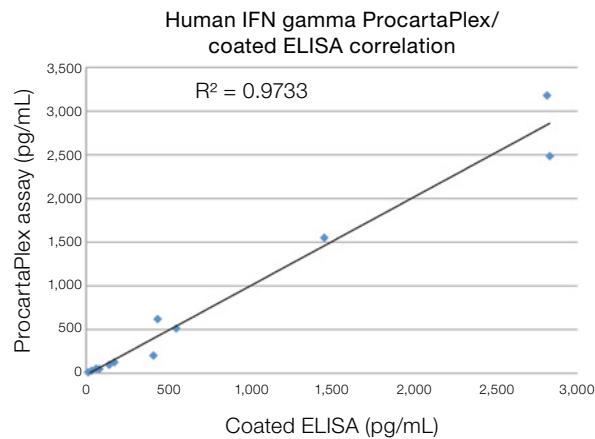

Figure 12. Results of an experiment measuring IFN gamma and TNF alpha in stimulated human and mouse peripheral blood mononuclear cells (PBMCs). Supernatants were serially diluted two-fold in normal human or mouse serum, to allow for differential cytokine levels in a serum matrix. Additional cytokines for human and mouse analytes were compared including IL-beta and IL-17A, and similar performance was obtained (data not shown).

Scalability

The ability to scale the number of analytes investigated in multiplex experiments is critical for the progression of many projects. For example, it is not uncommon to begin a research project by analyzing a large, comprehensive 35-plex cytokine panel on fewer samples (e.g., 100) to determine which analytes are affected by a particular disease or drug treatment. The resulting list of analytes can then be investigated further, for instance, using an 11-plex panel, on a larger set of samples. Thus, there is a great need for scalability in multiplex panel assays in order to

enable researchers to correlate all of their data across the different stages of their investigation. Many commercially available multiplex assays have not been developed with this level of consistency in mind. However, this specification is a key design requirement incorporated during the ProcartaPlex assay development. Data in Figures 13 and 14 illustrate the high correlation between similar analytes in a large and small panel and the scalability when using ProcartaPlex assays. Similar results are obtained when investigating other analytes.

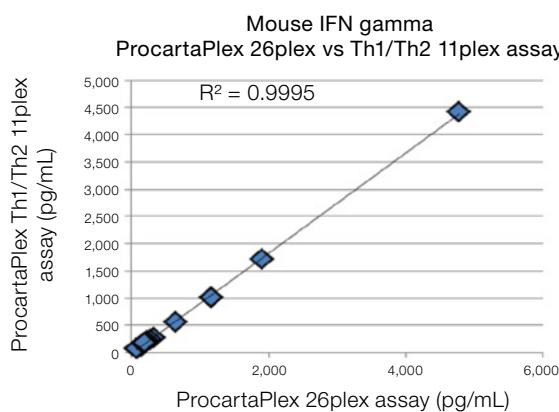

Figure 13. Data illustrates the high correlation between large- and small-scale multiplex scaling when using the ProcartaPlex assays.

ProcartaPlex High Sensitivity Immunoassays

Invitrogen™ ProcartaPlex™ High Sensitivity Immunoassays offer accurate quantitation of key cytokines significantly below the detection limit of conventional Luminex assays.

ProcartaPlex High Sensitivity Immunoassays feature

- Highest sensitivity detection of cytokine concentrations; in fg/mL
- Inter- and intra-assay coefficients of variation (CV) < 10%
- Small sample input (25 µL) ideal for precious serum or plasma samples
- Easy-to-use, simple ELISA-like protocol completed in less than 4 hours
- Convenient, ready-to-use kits for quantification of up to 9 cytokines (Figure 16)
- Trusted platform based on the principles of a sandwich ELISA and utilizing Luminex xMAP (multianalyte profiling) technology

ProcartaPlex High Sensitivity Immunoassays enable the multiplexed analysis of human and mouse analytes in very low concentrations in various matrices including serum, plasma, bodily fluids, and cell culture supernatant samples. These high-sensitivity multiplex assays are ideal when sample input is limited, and protein expression is in the low picogram/milliliter range.

Accurate quantification below conventional limits is achieved through a proprietary signal amplification technology. The signal amplification has negligible effects on the assay background, thereby increasing the signal-to-noise ratio of the cytokine standards on the lower end of the standard curve. This also allows for more accurate and reproducible measurement of cytokines with low expression levels.

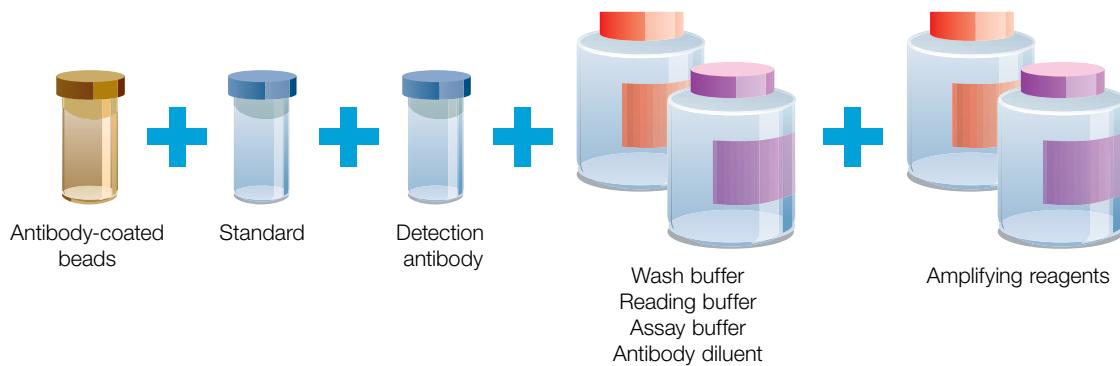

Figure 16. ProcartaPlex High Sensitivity panels include all of the reagents necessary to perform the assay.

ProcartaPlex Platinum Immunoassays

The Invitrogen™ ProcartaPlex™ Platinum Immunoassays are our most verified, bead-based multiplexing assay system. Similar to our Platinum ELISAs, ProcartaPlex Platinum assays have to pass more than 30 qualification criteria to guarantee reproducible high performance of the kits.

ProcartaPlex Platinum assays feature

- Matrix-specific diluents: optimized diluents for use with serum and plasma
- High performance: spike recovery and dilution linearity between 70–130%
- Sample friendly: only 25 µL of serum or plasma sample needed
- 100% combinability: all ProcartaPlex Platinum Simplex Kits can be combined with one another
- All in one: 100% of the required reagents are included in our panels

Overcome matrix effects

Serum and plasma samples are complex matrices with many components. This complexity can cause the “matrix effect”, which can impact the readout of many cytokines (low spike and dilution recovery). We developed matrix type-specific diluents to overcome these matrix and multiplex effects, assuring high-performance specifications comparable to those of traditional ELISAs. Spike and dilution recovery values in a range between 70–130% are obtainable with ProcartaPlex Platinum assays (Figure 17).

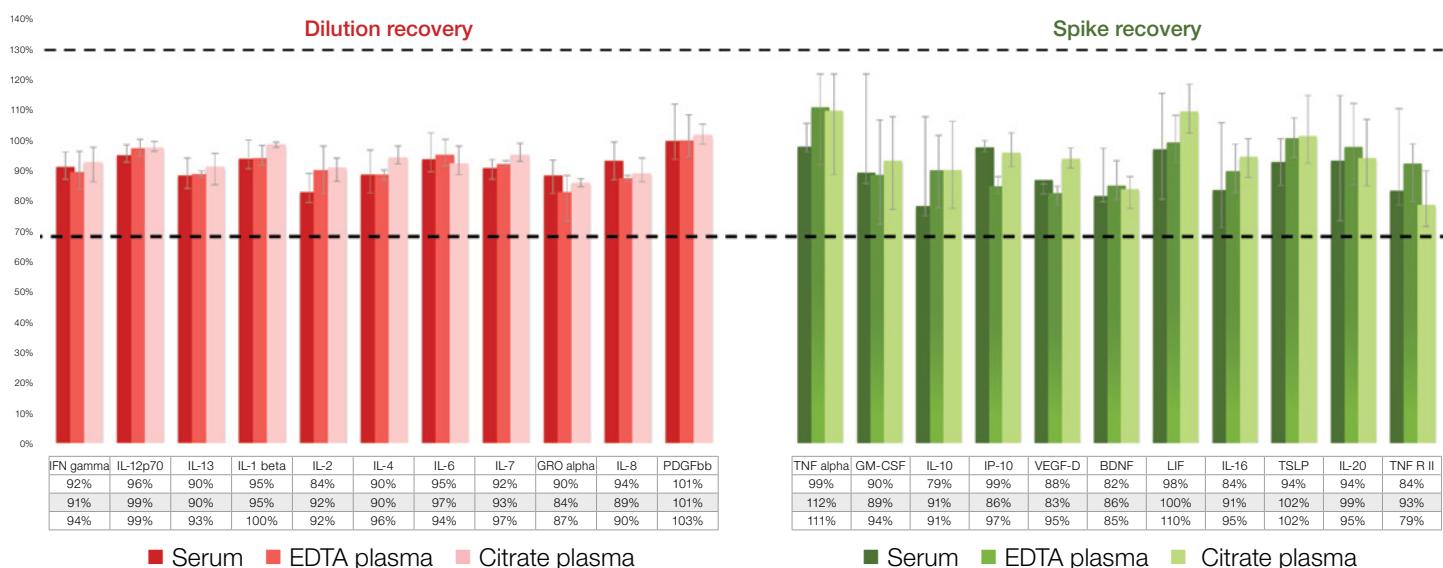

Figure 17. Dilution and spike recovery percentages were evaluated in a minimum of 5 individual donor samples per matrix by performing 4-fold serial dilutions, from 1:4 to 1:256. Mean recoveries for each matrix were calculated across the complete portfolio of ProcartaPlex Platinum assays, with a target specification of 100 ±30%.

100% combinable

ProcartaPlex Platinum Immunoassays are available in premixed panels and simplex kits. All ProcartaPlex Platinum Immunoassays are combinable with one another, eliminating any limitations on composition and size of your ProcartaPlex panel. You can select between two off-the-shelf panels or create your own custom panel.
